

1. Explain the role of linker and loader in compilation.
2. What is a NumPy array? How they are different from lists?
3. Write a flowchart that finds the sum of series:
4. Write a recursive function to find the sum of digits of a number.
5. Write a program that takes a sentence as input from the user and returns the frequency of each letter .Use a variable of dictionary type to maintain the count.
6. Take an array of 2 rows and three columns, populate it and find the transpose.
7. Write a function that reads the contents of the file myfile.txt and counts the number of alphabets, lowercase letters, uppercase letters, digits and number of words.
8. Take two NumPy arrays having two dimensions. Concatenate the arrays on axis 1.
9. Write a Python program to get the smallest number from a list.
10. Write a NumPy program to convert a Python dictionary to a NumPy ndarray.
11. Write a program code to open a data file save element values 2,4,9,10,11 in this data file and print these data values by accessing the file.
12. Write the basic steps required by the interpreter to execute a python program.
13. How memory is managed in Python? Give the tools name that help to find bugs or perform static analysis?
14. Define mutable and immutable data type.
15. Explain the concept of Linear and Binary search with Python program.
16. Illustrate the LEGB rules and its significance with help of suitable diagram.

## 1. Explain the role of linker and loader in compilation.

**Linker:** यह एक Special program है जो Compiler या Assembler द्वारा Generate object files के टुकड़ों को जोड़कर के एक Executable file बनाता है (.exe file). Object files में linker file के Execution के लिए आवश्यक सभी Libraries को Search करके जोड़ने का काम करता है। यह दो या दो से अधिक object program को Merge करता है और उनके बीच एक link बनाता है।

**Loader:** यह एक Special program है जो linker से Executable file को input लेता है और उसे main memory में load करता है, और computer द्वारा execution के लिए इसे तैयार करता है।

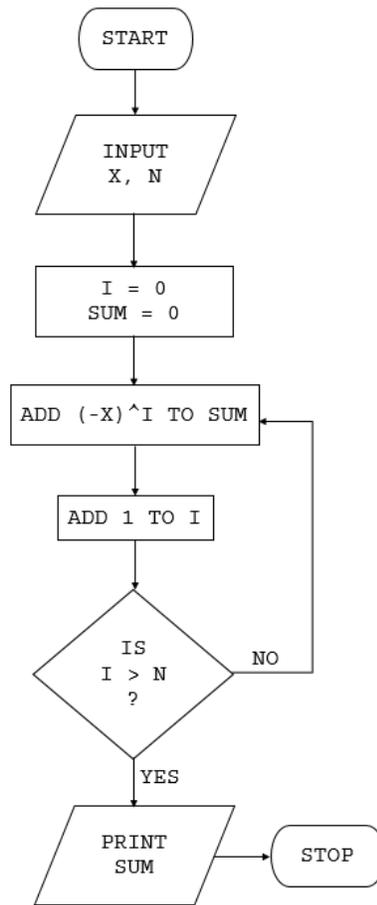

## 2. What is a NumPy array? How they are different from lists?

**NumPy:** NumPy python में scientific calculation के लिए एक बहुत ही अच्छा package है। NumPy array बड़ी संख्या में data पर advance mathematical और अन्य प्रकार के operations करने की सुविधा प्रदान करता है। NumPy कोई दूसरी programming language नहीं है, बल्कि यह एक python extension module है।

NumPy	List
Create NumPy array <code>numpy.array()</code>	Create List <code>L1 = [ ]</code>
by default Homogeneous	Homogeneous or heterogeneous.
Element wise operation is possible	Element wise operation is not possible
Low Memory consumption	High Memory consumption
Fast computing	Slow computing

3. Write a flowchart that finds the sum of series:  
 $s=1 + x/1 + x^2/2 + x^3/3 + ..$  upto n terms?

**Flowchart:**

4. Write a recursive function to find the sum of digits of a number.

**Program:**

```
def sum_of_digit( n ):
    if n == 0:
        return 0
    return (n % 10 + sum_of_digit(int(n / 10)))

num = 12345
result = sum_of_digit(num)
print("Sum of digits in",num,"is", result)
```

**Output:**

Sum of digits in 12345 is 15

5. Write a program that takes a sentence as input from the user and returns the frequency of each letter .Use a variable of dictionary type to maintain the count.

### Program:

```
test_str = "UPCISS"
all_freq = {}

for i in test_str:
    if i in all_freq:
        all_freq[i] += 1
    else:
        all_freq[i] = 1

print ("Count of all characters ",all_freq)
```

### Output:

Count of all characters {'U': 1, 'P': 1, 'C': 1, 'I': 1, 'S': 2}

6. Take an array of 2 rows and three columns, populate it and find the transpose.

### Program:

```
def transpose(A, B):
    for i in range(3):
        for j in range(2):
            B[i][j] = A[j][i]

A = [ [1, 1, 1],
       [2, 2, 2]]

B = [[0,0],[0,0],[0,0]]
transpose(A, B)

print("Result matrix is")
for i in range(3):
    for j in range(2):
        print(B[i][j], " ", end='')
    print()
```

### Output:

```
Result matrix is
1 2
1 2
1 2
```

7. Write a function that reads the contents of the file myfile.txt and counts the number of alphabets, lowercase letters, uppercase letters, digits and number of words.

### Program:

```
def count_str(st):
    alpha=low=upp=digit=0
    word=1
    for i in st:
        if i.isalpha():
            alpha+=1
            if i.islower():
                low+=1
            else:
                upp+=1
        elif i.isdigit():
            digit+=1
        elif i.isspace():
            word+=1
    print('Alphabets:',alpha)
    print('Lowercase:',low)
    print('Uppercase:',upp)
    print('Digits:',digit)
    print('Words:',word)

f = open('myfile.txt','r')
st= f.read()
count_str(st)
f.close()
```

### Output:

```
Alphabets: 28
Lowercase: 19
Uppercase: 9
Digits: 7
Words: 9
```

```
myfile.txt content
1 Hello Students
2 Welcome to UPCISS
3 4502
```

8. Take two NumPy arrays having two dimensions. Concatenate the arrays on axis 1.

### Program:

```
import numpy as np
arr1 = np.arange(1,10).reshape(3,3)
arr2 = np.arange(10,19).reshape(3,3)
print(arr1,'\n')
print(arr2,'\n')
arrcon = np.concatenate((arr1,arr2),axis=1)
print(arrcon)
```

## Output:

```
[[1 2 3]
 [4 5 6]
 [7 8 9]]
```

```
[[10 11 12]
 [13 14 15]
 [16 17 18]]
```

```
[[ 1  2  3 10 11 12]
 [ 4  5  6 13 14 15]
 [ 7  8  9 16 17 18]]
```

9. Write a Python program to get the smallest number from a list.

## Program:

```
li=[2,6,5,1,4]
small=li[0]
for i in li:
    if small > i:
        small=i
print(small)
```

**Output:** 1

10. Write a NumPy program to convert a Python dictionary to a NumPy ndarray.

## Program:

```
import numpy as np
dict = {0: 3, 1: 1, 2: 8, 3: 5}
nd_array = np.array(list(dict.items()))
print(nd_array)
```

## Output:

```
[[0 3]
 [1 1]
 [2 8]
 [3 5]]
```

11. Write a program code to open a data file save element values 2,4,9,10,11 in this data file and print these data values by accessing the file.

**Program:**

```
f = open('data.txt','r+')
f.write('2491011')
f.seek(0)
print(f.read())
f.close()
```

**Output:**

2491011

12. Write the basic steps required by the interpreter to execute a python program.

**Follow the steps written below.**

- Make a text file and save it with the name of your choice with an extension .py.
- Write the code to print hello world in the .py file and save your file.
- Open command prompt.
- Run the command – python filename.py.

13. How memory is managed in Python? Give the tools name that help to find bugs or perform static analysis?

जैसा कि हम जानते हैं, Python dynamic memory allocation को उपयोग करता है जिसे Heap data structure manage करता है।

Memory Heap उन object और अन्य data structure को रखता है जिनका उपयोग प्रोग्राम में किया जाएगा।

PyChecker और Pylint static analysis tool हैं जो Python में bugs खोजने में help करते हैं।

14. Define mutable and immutable data type.

Mutable: mutable data type में हम object की value को change कर सकते हैं। List, Sets, Dictionaries ये सब Mutable data type हैं।

Immutable: immutable data type में हम object की value को change नहीं कर सकते हैं। int, float, bool, str, tuple ये सब immutable data type हैं।

## 15. Explain the concept of Linear and Binary search with Python program.

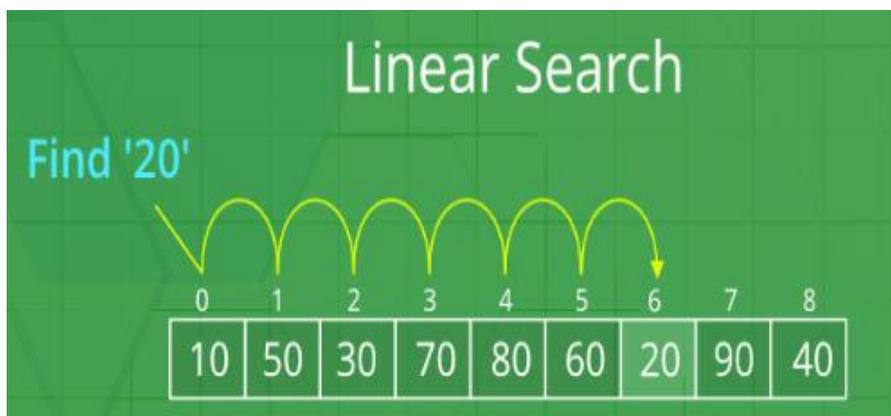

Linear Search simple approach को follow करता है, जैसे अगर हमें किसी array से किसी element को search करना है, तो हम उस element को array के सभी element के साथ एक-एक करके check करेंगे और अगर वो element हमें मिलता है तो हम उसे return कर देंगे। linear search में Binary Search की अपेक्षा समय ज्यादा लगता है। जैसे:-

```
# Program for Linear Search (Sequential Search)
def linear_search(arr, n, x):
    for i in range(0, n):
        if (arr[i] == x):
            return i
    return -1

arr = [10, 50, 30, 70, 80, 60, 20, 90, 40]
x = 20
n = len(arr)
result = linear_search(arr, n, x)
if(result == -1):
    print("Element is not present in array")
else:
    print("Element is present at index", result)
```

### Output:

Element is present at index 6

Binary Search एक searching algorithm है जो array को बार बार आधे में विभाजित करके element को search करता है। binary search हमेशा एक sorted array के साथ किया जाता है। यह Linear search की अपेक्षा कम समय लगाता है।

```
# Program for Binary Search

def binary_search(arr, x):
    low, high = 0, len(arr)-1
    while low <= high:
        mid = (low + high) // 2
        if x > arr[mid]:
            low = mid + 1
        elif x < arr[mid]:
            high = mid - 1
        else:
            return mid
    return -1

arr = [2,5,8,12,16,23,38,56,72,91]
x = 23
result = binary_search(arr, x)
if(result == -1):
    print("Element is not present in array")
else:
    print("Element is present at index", result)
```

## Output:

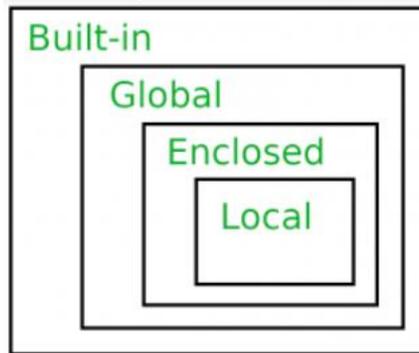

Element is present at index 5

Binary Search										
	0	1	2	3	4	5	6	7	8	9
Search 23	2	5	8	12	16	23	38	56	72	91
23 > 16 take 2 <sup>nd</sup> half	L=0	1	2	3	M=4	5	6	7	8	H=9
23 < 56 take 1 <sup>st</sup> half	0	1	2	3	4	L=5	6	M=7	8	H=9
Found 23, Return 5	0	1	2	3	4	L=5, M=5	H=6	7	8	9

## 16. Illustrate the LEGB rules and its significance with help of suitable diagram.

Program के अंतर्गत हर name reference के लिए अर्थात जो आप किसी function या program से variable को access करते हैं तो python हमेशा name resolution rule को अपनाता है जिसे LEGB rule कहते हैं।

- Local(L): Defined inside function/class
- Enclosed(E): Defined inside enclosing functions(Nested function concept)
- Global(G): Defined at the uppermost level
- Built-in(B): Reserved names in Python built-in modules

1. Write a program to print all Armstrong numbers in a given range. 2
2. Program to Check Armstrong Number. 2
3. Write a program to Print Fibonacci sequence. 3
4. Write a program to Check Prime Number. 3
5. Write a program to Find Factorial of Number. 4
6. Write a program to Check Leap Year. 4
7. Write a program to Check Palindrome Number. 5
8. Write a program to multiply two numbers by repeated addition e.g.  $5*6 = 5+5+5+5+5+5$  5
9. Write a program to input two numbers as input and compute the greatest common divisor (GCD). 6
10. Write a program to exchanging values of two variables. 6
11. Write a program for converting a decimal number to binary equivalent. 7
12. Write a program for converting a binary number to decimal equivalent. 7
13. Write a program to Bubble Sort. 8
14. Write a program to print elements of upper triangular matrix. 9
15. Write a program to print Pattern in Heart shape. 9
16. Write a program to print Triangle shape. 10
17. Write a program to compute the wages of a daily laborer as per the following rules: 11
18. Write a function that takes a string as parameter and returns a string with every successive repetitive character replaced by? e.g. school may become scho?!. 11
19. Write a program that takes in a sentence as input and displays the number of words, number of capital letters, number of small letters, number of digit and number of special symbols. 12
20. Write a Python function that takes two lists and returns true if they have at least one common item. 13
21. Write a program which takes list of numbers as input and finds, the largest number in the list, the smallest number in the list and Product of all the items in the list. 14
22. Write a program that takes sentence as input from the user and computes the frequency of each letter. Use a variable of dictionary type to maintain and show the frequency of each letter. 15
23. Write a function that takes two filenames f1 and f2 as input. The function should read the contents of f1 line by line and write them onto f2. 15
24. Write a function that reads the contents of the file f3.txt and counts the number of alphabets, blank spaces, lowercase letters, and number of words starting with a vowel. 16
25. Write a program to replace 'a' with 'b', 'b' with 'c'.....'z' with 'a' and similarly for 'A' with 'B', 'B' with 'C'..... 'Z' with 'A' in a file. The other characters should remain unchanged. 17
26. Write a NumPy program to find the most frequent value in an array. 17
27. Take two NumPy arrays having two dimensions. Concatenate the arrays on axis 1. 17

1. Write a program to print all Armstrong numbers in a given range.

**Program:**

```
x = 100 # Start Range
y = 500 # Stop Range
for num in range(x,y+1):
    length = len(str(num))
    sum=0
    temp=num
    while temp>0:
        sum = sum + ((temp % 10) ** length)
        temp //= 10
    if num == sum:
        print(num)
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
153
370
371
407
```

2. Program to Check Armstrong Number.

**Program:**

```
num = int(input("Enter a Number: "))

length = len(str(num))
sum = 0
temp = num

while(temp != 0):
    sum = sum + ((temp % 10) ** length)
    temp = temp // 10

if sum == num:
    print("Armstrong Number")
else:
    print("Not Armstrong Number")
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Enter a number: 371
Armstrong number
```

### 3. Write a program to Print Fibonacci sequence.

#### Program Using Loop:

```
num = int(input("Enter number of digits you want in series (minimum 2): "))

first = 0
second = 1

print("Fibonacci series is:")
print(first, ", ", second, end=", ")

for i in range(2, num):
    next = first + second
    print(next, end=", ")

    first = second
    second = next
```

#### Program Using Recursion:

```
def recur_fibo(n):
    if n <= 1:
        return n
    else:
        return(recur_fibo(n-1) + recur_fibo(n-2))

num = int(input("Enter number of digits you want in series (minimum 2): "))
if num <= 0:
    print("Plese enter a positive integer")
else:
    print("Fibonacci series is:")
    for i in range(num):
        print(recur_fibo(i),end=',')
```

#### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Enter number of digits you want in series (minimum 2): 8
Fibonacci series is:
0 , 1, 1, 2, 3, 5, 8, 13,
```

### 4. Write a program to Check Prime Number.

#### Program:

```
num = int(input("Enter a number: "))

for i in range(2, num//2):
    if num % i == 0:
        print("Not prime number")
        break
else:
    print(f"{num} Prime number")
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Enter a number: 67
67 Prime number
```

## 5. Write a program to Find Factorial of Number.

### Program Using Loop:

```
num = int(input("Enter a number: "))
fac = 1
for i in range(1, num + 1):
    fac = fac * i
print("Factorial of ", num, " is ", fac)
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Enter a number: 6
Factorial of 6 is 720
```

### Program Using Recursion:

```
def fact(n):
    if n == 0:
        return 1
    elif n == 1:
        return n
    else:
        return n*fact(n-1)

num = int(input("Enter a number: "))
if num < 0:
    print("Sorry, factorial does not exist for negative numbers")
else:
    print("Factorial of",num,"is",fact(num))
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Enter a number: 6
Factorial of 6 is 720
```

## 6. Write a program to Check Leap Year.

### Program:

```
year = int(input("Enter a year: "))
if(year%4==0 and (year%100!=0 or year%400==0)):
    print(year,"Leap year")
else:
    print(year,"Not leap year")
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Enter a year: 2020
2020 Leap year
```

## 7. Write a program to Check Palindrome Number.

### Program:

```
num = int(input("Enter a number: "))
temp , rev = num , 0
while temp != 0:
    rev = (rev * 10) + (temp % 10)
    temp //= 10
if num == rev:
    print(num,"Number is palindrome")
else:
    print(num,"Number is not palindrome")
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Enter a number: 565
565 Number is palindrome
```

## 8. Write a program to multiply two numbers by repeated addition e.g. $5*6 = 5+5+5+5+5+5$

### Program Using Loop:

```
num1 = 5
num2 = 6
total = 0
for i in range(num2):
    total+=num1
print("Result",total)
```

### Program Using Recursion:

```
def rep_add(a,b):
    if b==0:
        return 0
    return a + rep_add(a,b-1)

print("Result",rep_add(5,6))
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Result 30
```

9. Write a program to input two numbers as input and compute the greatest common divisor (GCD).

**Program Using Loop:**

```
n1 = 60
n2 = 48
loop=True
while loop:
    if n1 == n2:
        print(f"GCD: {n1}")
        loop=False
    elif n1>n2:
        n1 -= n2
    else:
        n2 -= n1
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
GCD: 12
```

**Program Using Recursion:**

```
def GCD(a,b):
    if(b==0):
        return a
    else:
        return GCD(b,a%b)
print (GCD(60,48))
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
12
```

10. Write a program to exchanging values of two variables.

**Program:**

```
x, y = 25, 36
temp = x
x = y
y = temp
print(f"After Swap x = {x}, y = {y}")
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
After Swap x = 36, y = 25
```

11. Write a program for converting a decimal number to binary equivalent.

**Program Using Recursion:**

```
def DecimalToBinary(num):  
    if num == 0:  
        return  
    else:  
        DecimalToBinary(num//2)  
        print(num % 2, end = '')
```

```
DecimalToBinary(8)
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop  
$ python kk.py  
1000
```

12. Write a program for converting a binary number to decimal equivalent.

**Program:**

```
def binaryToDecimal(binary):  
  
    binary1 = binary  
    decimal, i, = 0, 0  
    while binary != 0:  
        dec = binary % 10  
        decimal = decimal + dec * pow(2, i)  
        binary = binary//10  
        i += 1  
    print(binary1, '=', decimal)
```

```
binaryToDecimal(10101)
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop  
$ python kk.py  
10101 = 21
```

## 13. Write a program to Bubble Sort.

### Program Using while Loop:

```
lis=[6,9,7,5,8,4]
print(f"Unsorted List: {lis}")
i=len(lis)-1
while i > 0 :
    j=0
    while j < i:
        if lis[j] > lis[j+1]:
            lis[j],lis[j+1] = lis[j+1],lis[j]
            print(lis)
        else:
            print(lis)
        j+=1
    print()
    i-=1
```

### Program Using For Loop:

```
for i in range(len(lis)-1):
    for j in range(len(lis)-1-i):
        if lis[j] > lis[j+1]:
            lis[j],lis[j+1] = lis[j+1],lis[j]
            print(lis)
        else:
            print(lis)
    print()
```

```
print(f"Sorted List: {lis}")
```

### Output:

UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop

\$ python kk.py

Unsorted List: [6, 9, 7, 5, 8, 4]

[6, 9, 7, 5, 8, 4]

[6, 7, 9, 5, 8, 4]

[6, 7, 5, 9, 8, 4]

[6, 7, 5, 8, 9, 4]

[6, 7, 5, 8, 4, 9]

[6, 7, 5, 8, 4, 9]

[6, 5, 7, 8, 4, 9]

[6, 5, 7, 8, 4, 9]

[6, 5, 7, 4, 8, 9]

[5, 6, 7, 4, 8, 9]

[5, 6, 7, 4, 8, 9]

[5, 6, 4, 7, 8, 9]

[5, 6, 4, 7, 8, 9]

[5, 4, 6, 7, 8, 9]

[4, 5, 6, 7, 8, 9]

Sorted List: [4, 5, 6, 7, 8, 9]

14. Write a program to print elements of upper triangular matrix.

**Program:**

```
mat=[[1,2,3],
     [4,5,6],
     [7,8,9]]
row=col=3
print('Elements of Upper triangular matrix')
if row==col:
    for i in range(row):
        for j in range(col):
            if j>=i:
                print(mat[i][j],end=" ")
else:
    print("not a square matrix")
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Elements of Upper triangular matrix
1 2 3 5 6 9
```

15. Write a program to print Pattern in Heart shape.

**Program:**

```
for row in range(6):
    for col in range(7):
        if (row==0 and col%3!=0) or (row==1 and col%3==0) or (row-col==2) or
(row+col==8):
            print("\U0001F49B ",end="")
        else:
            print(end=" ")
    print()
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
  ♥ ♥ ♥ ♥ ♥
♥ ♥ ♥ ♥ ♥
♥ ♥ ♥ ♥ ♥
♥ ♥ ♥ ♥ ♥
♥ ♥ ♥ ♥ ♥
♥ ♥ ♥ ♥ ♥
```

## 16. Write a program to print Triangle shape.

### Program:

```
size = 4
for i in range(size):
    for j in range (i+1):
        if j==0 or j==i:
            print("*",end=" ")
        else:
            print(" ",end=" ")
    print()
lowsize = size-1
for i in range(lowsize-1):
    for j in range(lowsize-i):
        if j==0 or j==lowsize-i-1:
            print("*",end=" ")
        else:
            print(" ",end=" ")
    print()
print("*")
```

### Output:

UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop

\$ python kk.py

```
*
* *
*  *
*  *
* *
*
```

## 17. Write a program to compute the wages of a daily laborer as per the following rules:

Hours Worked Rate Applicable upto first 8 hrs Rs100/- per hr

- a) For next 4 hrs Rs30/- per hr extra
- b) For next 4 hrs Rs40/- per hr extra
- c) For next 4 hrs Rs50/- per hr extra
- d) For rest Rs60/- per hr extra

### Program:

```
employee_name = 'Suresh Kumar'
worked_hour = 15
if worked_hour <=8:
    wages = worked_hour*100
elif worked_hour >8 and worked_hour <=12:
    wages = (worked_hour-8)*30+worked_hour*100
elif worked_hour >12 and worked_hour <=16:
    wages = (worked_hour-8)*40+worked_hour*100
elif worked_hour >16 and worked_hour <=20:
    wages = (worked_hour-8)*50+worked_hour*100
else:
    wages = (worked_hour-8)*60+worked_hour*100
print("Total Wages: ",wages)
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Total Wages: 1780
```

## 18. Write a function that takes a string as parameter and returns a string with every successive repetitive character replaced by? e.g. school may become scho?l.

### Program:

```
def fun1(st):
    ch=[]
    for i in st:
        ch.append(i)
    for i in range(len(ch)-1):
        if ch[i] == ch[i+1]:
            ch[i+1] = '?'
    return ''.join(ch)

st = 'schools schools'
print(fun1(st))
```

### Output:

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
scho?ls scho?ls
```

19. Write a program that takes in a sentence as input and displays the number of words, number of capital letters, number of small letters, number of digit and number of special symbols.

**Program:**

```
snt='We1come To UPC1$$ Y0uTube Ch@nnel'  
if len(snt) == 0:  
    print("String is Empty")  
else:  
    word=1  
    capital=small=alnum=spe_ch=0  
    for i in snt:  
        if i.isspace():  
            word+=1  
        elif i.isupper():  
            capital+=1  
        elif i.islower():  
            small+=1  
        elif i.isalnum():  
            alnum+=1  
        else:  
            spe_ch+=1  
    else:  
        print(snt)  
        print(f"Number of Words: {word}")  
        print(f"Number of Upper: {capital}")  
        print(f"Number of Lower: {small}")  
        print(f"Number of Digit: {alnum}")  
        print(f"Number of Special Symbols: {spe_ch}")
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop  
$ python kk.py  
We1come To UPC1$$ Y0uTube Ch@nnel  
Number of Words: 5  
Number of Upper: 8  
Number of Lower: 15  
Number of Digit: 3  
Number of Special Symbols: 3
```

20. Write a Python function that takes two lists and returns true if they have at least one common item.

**Program:**

```
def common_data(list1, list2):  
    result = False  
    for x in list1:  
        for y in list2:  
            if x == y:  
                result = True  
                return result  
    return result
```

```
a = [1, 2, 3, 4, 5]  
b = [5, 6, 7, 8, 9]  
print(common_data(a, b))
```

```
a = [1, 2, 3, 4, 5]  
b = [6, 7, 8, 9]  
print(common_data(a, b))
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
```

```
$ python kk.py
```

```
True
```

```
False
```

21. Write a program which takes list of numbers as input and finds, the largest number in the list, the smallest number in the list and Product of all the items in the list.

**Program:**

```
li=[ int(l) for l in input("List: ").split(",")]
print("The list is ",li)
max=min=li[0]
pro=1
for x in li:
    if x>max:
        max=x
    if x<min:
        min=x
    pro*=x
print(f"Largest Number: {max}")
print(f"Smallest Number: {min}")
print(f"Product of All Item: {pro}")
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
List: 3,5,2,4,8,7
The list is [3, 5, 2, 4, 8, 7]
Largest Number: 8
Smallest Number: 2
Product of All Item: 6720
```

22. Write a program that takes sentence as input from the user and computes the frequency of each letter. Use a variable of dictionary type to maintain and show the frequency of each letter.

**Program:**

```
test_str = "welcome to upciss"
all_freq = {}
for i in test_str:
    if i in all_freq:
        all_freq[i] += 1
    else:
        all_freq[i] = 1
print ("Count of all characters in GeeksforGeeks is :\n " + str(all_freq))
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ python kk.py
Count of all characters in GeeksforGeeks is :
{'w': 1, 'e': 2, 'l': 1, 'c': 2, 'o': 2, 'm': 1, ' ': 2, 't': 1, 'u': 1, 'p': 1, 'i': 1, 's': 2}
```

23. Write a function that takes two filenames f1 and f2 as input. The function should read the contents of f1 line by line and write them onto f2.

**Program:**

```
def filefunc(f1,f2):
    openf1=open(f1,'r')
    openf2=open(f2,'w+')
    print("File 1 Content:\n",openf1.read())
    openf1.seek(0)
    openf2.write(openf1.read())
    openf2.seek(0)
    print("File 2 Content:\n",openf2.read())
    openf1.close()
    openf2.close()
```

```
f1=input("Enter a Frist File Name: ")
f2=input("Enter a Second File Name: ")
filefunc(f1,f2)
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
$ py demo.py
Enter a Frist File Name: f1.txt
Enter a Second File Name: f2.txt
File 1 Content:
Hello Students
Welcome To UPCISS
Thank for Like and Subscribe
File 2 Content:
Hello Students
Welcome To UPCISS
Thank for Like and Subscribe
```

24. Write a function that reads the contents of the file f3.txt and counts the number of alphabets, blank spaces, lowercase letters, and number of words starting with a vowel.

**Program:**

```
def filefunc(f3):
    file3=open(f3, 'r')
    snt=file3.read()
    file3.close()
    if len(snt) == 0:
        print("String is Empty")
    else:
        alpha=space=lower=vowel=0
        for i in snt:
            if i.isalpha():
                alpha+=1
            elif i.isspace():
                space+=1
            if i.islower():
                lower+=1
        vow='aeiou'
        li=snt.split(' ')
        for word in li:
            for x in vow:
                if word.startswith(x):
                    vowel+=1
        print(f"File Content:\n{snt}\n")
        print(f"Number of Alphabets: {alpha}")
        print(f"Number of Blank Space: {space}")
        print(f"Number of Lowercase: {lower}")
        print(f"Starting with a vowel: {vowel}")
```

```
filefunc("f3.txt")
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop
```

```
$ py demo.py
```

```
File Content:
```

```
Hello Students!
```

```
Welcome T0 UPCISS
```

```
Thank for Like and Subscribe
```

```
Number of Alphabets: 51
```

```
Number of Blank Space: 9
```

```
Number of Lowercase: 38
```

```
Starting with a vowel: 1
```

25. Write a program to replace 'a' with 'b', 'b' with 'c'.....'z' with 'a' and similarly for 'A' with 'B','B' with 'C'..... 'Z' with 'A' in a file. The other characters should remain unchanged.

**Program:**

```
s1='UPci$$ c0mpuTer'  
s2=[]  
for i in s1:  
    if i.isalpha():  
        s2.append(chr(ord(i)+1))  
    else:  
        s2.append(i)  
s2=''.join(s2)  
print(s2)
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop  
$ py demo.py  
VQdj$$ d0nqvUfs
```

26. Write a NumPy program to find the most frequent value in an array.

**Program:**

```
import numpy as np  
x = np.array([5,9,6,9,6,2,6])  
print("Original array:")  
print(x)  
print("Most frequent value in the above array:")  
print(np.bincount(x).argmax())
```

**Output:**

```
UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop  
$ py demo.py  
Original array:  
[5 9 6 9 6 2 6]  
Most frequent value in the above array:  
6
```

27. Take two NumPy arrays having two dimensions. Concatenate the arrays on axis 1.

**Program:**

```
import numpy as np  
arr1 = np.arange(1,10).reshape(3,3)  
arr2 = np.arange(10,19).reshape(3,3)  
print(arr1)  
print()  
print(arr2)  
print()  
print(np.concatenate((arr1,arr2),axis=1))
```

**Output:**

UPCISS@DESKTOP-32007C6 MINGW64 ~/desktop

\$ py demo.py
